# Sarah Connor

AI Security Engineer · Adversarial ML & Red Teaming
sarah@sconnor.dev · Austin, USA · +1 123 456 7890
github.com/sconnor · linkedin.com/in/sarahconnor · sconnor.dev

## SUMMARY

AI security engineer with six years spanning applied machine learning, security engineering, and detection engineering. Builds defenses against adversarial and prompt-injection attacks on production ML systems, and leads red-team exercises against internal LLM deployments.

## EXPERIENCE

### Senior AI Security Engineer
2023 – Present
Cyberdyne Systems — Austin, USA

Leading red-team engagements against internal LLM-powered products before launch.

- Built an automated prompt-injection fuzzing harness that surfaced 40+ high-severity jailbreaks across 6 production LLM features prior to release.
- Led adversarial robustness reviews for a fraud-detection model serving 2M inference requests/day, reducing evasion success rate from 18% to under 2%.
- Designed and shipped a model-extraction detection pipeline (query-pattern anomaly scoring) now running across all customer-facing inference endpoints.

Python · PyTorch · Burp Suite · Kubernetes · OPA/Gatekeeper

### Security Engineer, Applied ML
2021 – 2023
Skynet Analytics — Remote

Owned the security review process for the ML platform team's model deployment pipeline.

- Authored the org's first threat model for LLM-integrated services, adopted as the standard review template company-wide.
- Cut mean time to patch critical model-serving CVEs from 21 days to 4 by embedding security gating directly into the MLOps CI/CD pipeline.
- Ran quarterly red-team exercises against internal chatbots, discovering data-exfiltration paths later closed via output filtering and scoped tool permissions.

Terraform · AWS · MLflow · Semgrep · Snyk

### Machine Learning Engineer
2019 – 2021
Tyrell ML — Ljubljana, Slovenia

Built and shipped machine learning models powering fraud detection and demand forecasting for a fast-growing fintech product.

- Built and shipped fraud-detection models into production, reducing false-positive rates by 25% across the company's core payments pipeline.
- Designed the team's first automated retraining pipeline, cutting model refresh time from weeks to days.

TensorFlow · scikit-learn · Docker

## SKILLS

| | |
|---|---|
| **Security** | Threat modeling, Burp Suite, Nmap, Metasploit |
| **ML/AI** | PyTorch, vLLM, adversarial robustness, prompt-injection defense |
| **Infra** | Kubernetes, Terraform, AWS, CI/CD pipeline hardening |
| **Practice** | Incident response, vulnerability research, red-team exercise design |

## EDUCATION

**M.S. Computer Security** 2023
Stanford University Stanford, USA

**B.S. Computer Science** 2019
University of Ljubljana Ljubljana, Slovenia

## PROJECTS

**Prompt Injection Firewall** 2023
github.com/sconnor/promptfirewall

## CERTIFICATIONS, AWARDS & PUBLICATIONS

**OSCP – Offensive Security Certified Professional** 2019
Offensive Security

**AI Village CTF – 1st Place** 2024
DEF CON 24, Las Vegas, USA

**Detecting Prompt Injection at Scale** 2024
